[ML20] Assignment 8

Your Name

Due: Mar 27 (before class)

- [1] If $\kappa_1(a,b)$ and $\kappa_2(a,b)$ are two valid kernels, prove that $g(a,b) = \kappa_1(a,b) + \kappa_2(a,b)$ is also a valid kernel.
- [2] Kernel ridge regression is a powerful nonparameteric model but suffers from the $O(n^3)$ computational complexity, where n is the size of training set. Please develop an efficient approximation KRR (AKRR).

Here are the requirements:

(i) Your model β still minimizes training error over the entire training set, i.e.,

$$J(\beta) = \sum_{i=1}^{n} (\phi(x_i)^T \beta - y_i)^2 + \lambda \beta^T \beta.$$
 (1)

(ii) For AKRR, assume the optimal model is made of k random training instances (k < n), i.e.,

$$\beta = \sum_{j=1}^{k} \alpha_j \phi(x_j). \tag{2}$$

(iii) Plug (2) back to (1), and derive the analytic solution of $\alpha = [\alpha_1, \dots, \alpha_n]^T$. Importantly, show that the computational complexity of getting α is now $O(k^3)$.

.

Implement KRR and AKRR, using Gaussian kernel with hyper-parameter σ . Report your results below.

(a) Draw a figure of two curves for KRR. One is its training MSE versus σ and the other is its testing MSE versus σ . Properly choose 7 candidate values of σ so we may observe overfitting and underfitting.

Fig. 1. KRR MSE versus σ .

(b) Properly choose a σ for AKRR and fix it. Draw a figure of two curves for AKRR. One is its training MSE versus k and the other is its testing MSE versus k. Choose 7 candidate values of k and a proper σ so that you can get as smooth and convergent curves as possible.

Fig. 2. AKRR MSE versus k. Here $\sigma = \dots$

(c) [Bonus] ARKK+ is built on ARKK, but it selects k training instances in a non-random fashion. Please propose your own selection technique and briefly explain it here. You will get 30% bonus if you can show ARKK+ outperforms ARKK, i.e., under the same k and σ , ARKK+ has lower testing MSE – however, both ARKK and ARKK+ show have reasonable testing MSE, as compared with KRR. Report your results in the following table. (Search Python library that can record the running time of a segment of codes.)

Table 1. Performance of KRR, AKRR and AKRR+ $(k=...,\,\sigma=...)$

Method	Training MSE	Testing MSE	Training Time
KRR			
AKRR			
AKRR+
